LESSISMORE: best or rest multi-objective optimization.
(c) 2022 Tim Menzies, timm@ieee.org
"I think the highest and lowest points are the important ones.
 Anything else is just...in between." ~ Jim Morrison

USAGE:
  alias lim="lua lessismore.lua"
  lim [OPTIONS]

OPTIONS:
  -H  --how   good or bad or novel    = good
  -m  --min    exponent of min size   = .5
  -b  --bins   max bins               = 16
  -s  --seed   random number seed     = 10019
  -S  --some   number of nums to keep = 256
  -p  --p      exponent of distance   = 2

OPTIONS (other):
  -f  --file  where to find data      = ../etc/data/auto93.csv
  -h  --help  show help               = false
  -r  --rnd   rounding rules          = %5.2f
  -g  --go    start up action         = nothing

-------------------------------------------------------------------------------
-- ## Coding Conventions
-- - _Separate policy from mechanism:_
--   All "magic parameters" that control code behavior should be part
--   of that help text. Allow for `-h` on the command line to print
--   help.  Parse that string to set the options.
-- - _Dialogue independence_:
--    Isolate and separate operating system interaction.
-- - _Test-driven development_:
--   The `go` functions store tests.
--   Tests should be silent unless they --   fail. ~tests can be
--   disabled by renaming from `go.fun` to `no.fun`. Tests should
--   return `true` if the test passes.  On exit, return number of
--   failed tests.
-- - _Write less code:_
--   "One of my most productive days was throwing away 1,000 lines of code."
--    (Ken Thompson);
--   "It is vain to do with more what can be done with less."
--    (William of Occam);
--   "Less, but better"
--    (Dieter Rams).
--   Good code is short code. If you know what is going on, the code
--   is shorter. While the code is longer, find patterns of processing
--   that combines N things into less things. Strive to write shorter.
--   Lots of short functions. Methods listed alphabetically.
--   Code 80 chars wide, or less.  Functions in 1 line,
--   if you can. Indent with two spaces. Divide code into 120 line (or
--   less) pages.  Use `i` instead of `self`.
--   Minimize use of local (exception: define all functions
--   local at top of file).
-- - _Encapsulation:_
--   Use polymorphism but no inheritance (simpler
--   debugging).  All classes get a `new` constructor.
--   Use UPPERCASE for class names.
-- - _Class,Responsibilities,Collaborators_:
--   Each class is succinctly documented as a set of collaborations
--   to fulfill some --   responsibility.
--
-- ## About the Learning
-- - Data is stored in ROWs.
-- - Beware missing values (marked in "?") and avoid them
-- - Where possible all learning should be  incremental.
-- - Standard deviation and entropy generalized to `div` (diversity);
-- - Mean and mode generalized to `mid` (middle);
-- - Rows are created once and shared between different sets of
--   examples (so we can accumulate statistics on how we are progressing
--   inside each row).
-- - When a row is first created, it is assigned to a `base`; i.e.
--   a place to store the `lo,hi` values for all numerics.
-- - XXX tables very useful
-- - XXX table have cols. cols are num, syms. ranges
