34
35 --- ## Coding Conventions
36 -- "Separate policy from mechanism:
37 -- All "magic parameters" that control code behavior should be part
38 -- of that help text. Allow for '-h' on the command line to print
39 -- help. Parse that string to set the options.
40 -- Dialogue independence: Isolate and separate operating system interaction.
41 -- "Test-driven development: The 'go' functions store tests.
42 -- Tests should be silent unless they -- fail. -tests can be
43 -- disabled by renaming from 'go.fun' to 'no.fun'. Tests should
44 -- return 'true' if the test passes. On exit, return number of
45 -- failed tests.
46 -- Less is more: Code 80 chars wide, or less. Functions in 1 line,
47 -- if you can. Indent with two spaces. Divide code into 120 line (or
48 -- less) pages. Use 'i' instead of 'self'. Use '_' to denote the
49 -- last created class/ Use '_' for anonymous variables.s Minimize
50 -- use of local (exception: define all functions as local at top of
51 -- file).
52 -- Encapsulation: Use polymorphism but no inheritance (simpler
53 -- debugging). All classes get a 'new' constructor.
54 -- Use UPPERCASE for class names.
55
56 --- ## About the Learning
57 -- Data is stored in ROWs.
58 -- Beware missing values (marked in "?") and avoid them
59 -- Where possible all learning should be incremental.
60 -- Standard deviation and entropy generalized to 'div' (diversity);
61 -- Mean and mode generalized to 'mid' (middle);
62 -- Rows are created once and shared between different sets of
63 -- examples (so we can accumulate statistics on how we are progressing
64 -- inside each row).
65 -- When a row is first created, it is assigned to a 'base'; i.e.
66 -- a place to store the 'lo,hi' values for all numerics.
67 -- XXX tables very usef
68
69 --- XXX table have cols. cols are num, syms. ranges
70
